Controls

Layout overview

Roughly speaking, the top encoder section controls looping and beat jumps, the left rotary potentiometer section controls the stem EQ, the switch matrix section controls a range of deck and global controls, and the bottom rotary section control browser, pitch and UI views. Shift retains it's use of providing access to alternate controls for a lot of inputs, the layer button accesses other command layers

Latch layers functionality does not use inbuilt, hardware-side, layering system. It's written from the ground up in VirtualDJ and mimics inbuilt latch-layer setting 2. That is, the latch layer button changes the functionality of the button matrix A-P. However, instead of cycling through 3 layers by repeatedly pressing the latch layer button, the button brings you to a menu page where each of the buttons represents a unique layer. This makes for a total of 16 layers, with 16 more theoretically possible using the shift button.

Faders of both controllers and the rotary potentiometer section including the pot switches of the right controller are completely unmapped, allowing for custom user mapping in VirtualDJ or other software (e.g. channel faders in Ableton, controls of external FX, etc).
