Controls

Layout overview

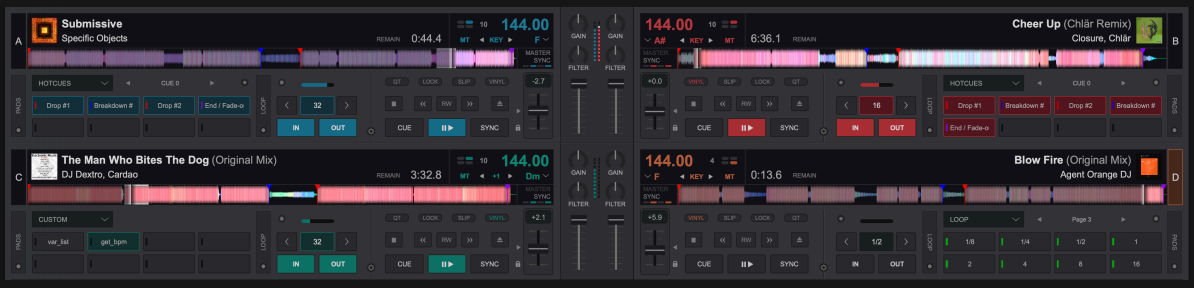

Roughly speaking, the top encoder section controls looping and beat jumps, the left rotary potentiometer section controls the stem EQ, the switch matrix section controls a range of deck and global controls, and the bottom rotary section control browser, pitch and UI views. Shift retains it's use of providing access to alternate controls for a lot of inputs, the layer button accesses other command layers

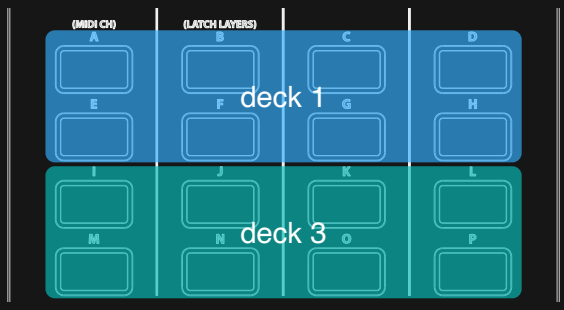

Latch layers functionality does not use inbuilt, hardware-side, layering system. It's written from the ground up in VirtualDJ and mimics inbuilt latch-layer setting 2. That is, the latch layer button changes the functionality of the button matrix A-P. However, instead of cycling through 3 layers by repeatedly pressing the latch layer button, the button brings you to a menu page where each of the buttons represents a unique layer. This makes for a total of 16 layers, with 16 more theoretically possible using the shift button.

Faders of both controllers and the rotary potentiometer section including the pot switches of the right controller are completely unmapped, allowing for custom user mapping in VirtualDJ or other software (e.g. channel faders in Ableton, controls of external FX, etc).

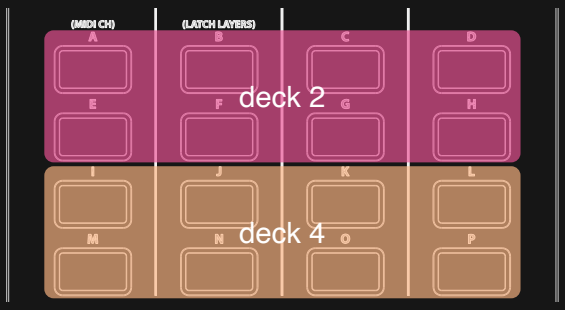

With the exception of the stem EQ, controls targeting individual decks are split across the two controllers.

left K2 switch matrix

right K2 switch matrix

The arrangement mimics the way decks are shown in performance mode within VirtualDJ. Deck controls are thus “stacked” vertically, instead of being lined up in columns horizontally like in most other mappings.

left K2 top encoder section

right K2 top encoder section

The upper encoder section has the “top” deck on the left and the “bottom” deck on the right,

Button matrix pages

Layer Page - Menu

Pressing the layer button on any of the other pages takes you to this page. Pushing any of the switches A-P takes the user to the switch's associated page of commands.

Page J — QFPro (default view)

QFPro stack/range across four banks: **E*nergy,** H*appy, **D*ance,** P*op. Each column is one bank; each row is one offset value from the master tag (stack adds only that value; range covers everything from master out to that value).

Labels show the **default** view (`@\$qfwin = 0`), with rows +3/+2/+1/0 from top. Either controller's bottom-right encoder cycles `@\$qfwin` 0↔3, sliding the visible 4-row window through the virtual 7-row layout (+3 down to –3). The row currently showing `0` blinks: green if range-0 engaged, orange if stack-0 engaged, red as a plain "this is 0" marker.
